

Jagaad Golang Test Case

1- Create a cli command

We have two api that give us a list of users. We need a cli command that will fetch users from those endpoints and save user information into a csv file.

2- Create a cli command for searching users who has specific tags

We need a command for searching users that have specific tags inside of the created csv file (see first item). Tags should be given via flag (like - - tag=sometag,anothertag). Users must have all given tags. When a user is found with given tags, its name and salary should be written on the output as a list.

Endpoints

First api that needs to be hit: <https://run.mocky.io/v3/03d2a7bd-f12f-4275-9e9a-84e41f9c2aae>

(Yes, we know it gives 500 error, please handle the situation)

Second api: <https://run.mocky.io/v3/87931203-8086-43ef-ba16-4c8903d8fa88>

Very Important Note: These api urls look similar but, **please** consider these two endpoints as two different providers.

Requirements;

- Using latest version of golang is important
- Having tests is important
